

Prevention is better than cure...It is cheaper in the long run, and far less painful, to invest effectively to prevent a breach (of security) rather than to pick up the pieces and repair the damage after the event.

– KPMG 2002 Global Information Security Survey

**Enterprise Systems & Security**

Information security—the process of protecting data from unauthorized access, use, disclosure, destruction, modification, or disruption—is a critical issue for companies around the world. An Information Security Program is the cornerstone of any organization’s ability to maintain a secure and compliant information infrastructure for paper-based and electronic information.

An Information Security Program designed to meet established international standards, such as ISO 17799, ensures an Information Security Program that is complaint with industry best practices.

Records & Information Management

Entium Technology Partners develops comprehensive Information Security Programs that address information security requirements, including risk management, incident response, policy and procedure development, and vulnerability management. Our enterprise approach to information security protects businesses from security risks, both inside and outside of the physical company boundaries.

Business Continuity Planning

The overall goal of any comprehensive Information Security Program is to align company staff, business processes, corporate policy and procedures, and technology to provide an integrated plan to reduce risk to the enterprise and extend the information security envelope to encompass the full lifecycle of a company’s paper-based and electronic information.

Domestic & Global Regulatory Research

ECM Technology Implementation
